Contents

03 A full session, no cuts

A New York AM session, traded live and left unedited. Every fill you'll see below went out to six funded accounts at once through Tradecopia: same price, same size, same time.

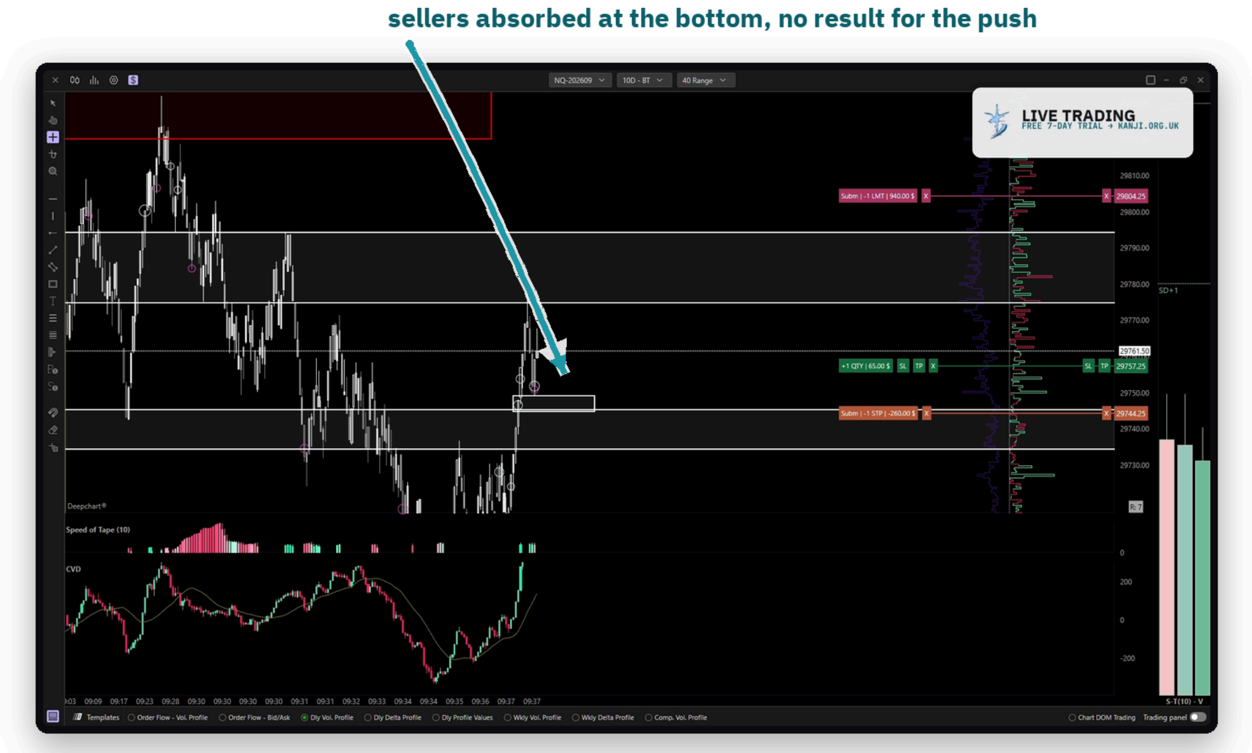
The read underneath it is order flow only, no indicators beyond CVD and speed of tape. Location tells you where price sits in the higher timeframe auction. Absorption tells you who's defending it. Refresh and pacing tell you whether that defense is thickening or thinning. None of it is prediction. It's a read of what's actually happening at the price, and a reaction to it.

Four trades from this session are broken down on the pages that follow: two wins, a loss, and the trade that closed the day. The loss is in here on purpose. If you only ever see the wins, you don't learn what a real session looks like.

04

Trade 1: the refill

Before: sellers absorbed at the bottom



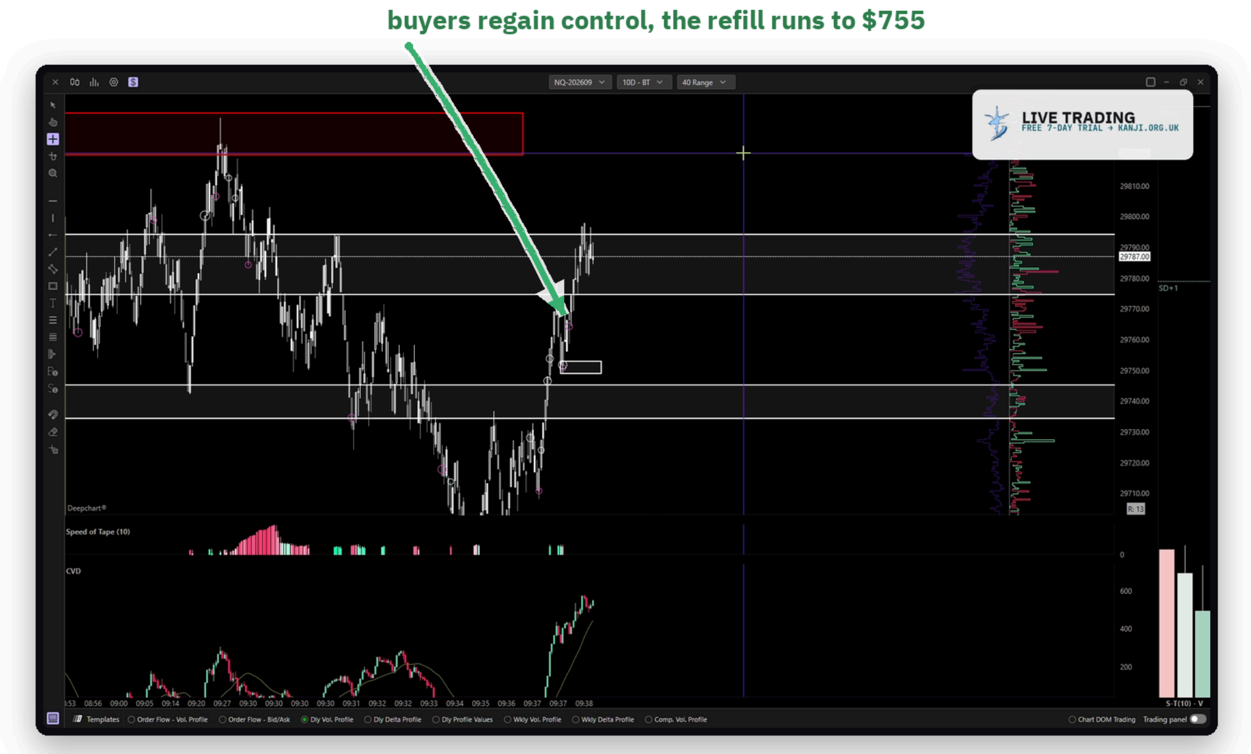
Sellers get absorbed at the bottom of the range here, the two small circles marking where buyers stepped in and held. The stop sits just below.

This is the session's opening trade, and the read was simple: “sellers are being absorbed at the bottom, stop just below these buyers that are in control, targeting higher timeframe objective.” Sellers had pushed lower and gotten nothing for it, so price refilled straight back into the buyers defending that level.

That refill is the signal itself, not a guess at direction. It's a read of who's actually winning the fight for that price.

Trade 1: the refill

After: buyers regain control, +$755



Same setup, zoomed out. Buyers regain control and the move runs straight into the target.

The stop sat just below the absorption. The target was the higher timeframe objective sitting directly above. It closed for $755.

In the moment, this was the cleanest trade of the day: “that was the trade for today.” Three more worth showing turned up later in the session anyway, and not all of them were this tidy.

Reading absorption and refill in real time, live, is exactly what the free trial's sessions walk through.

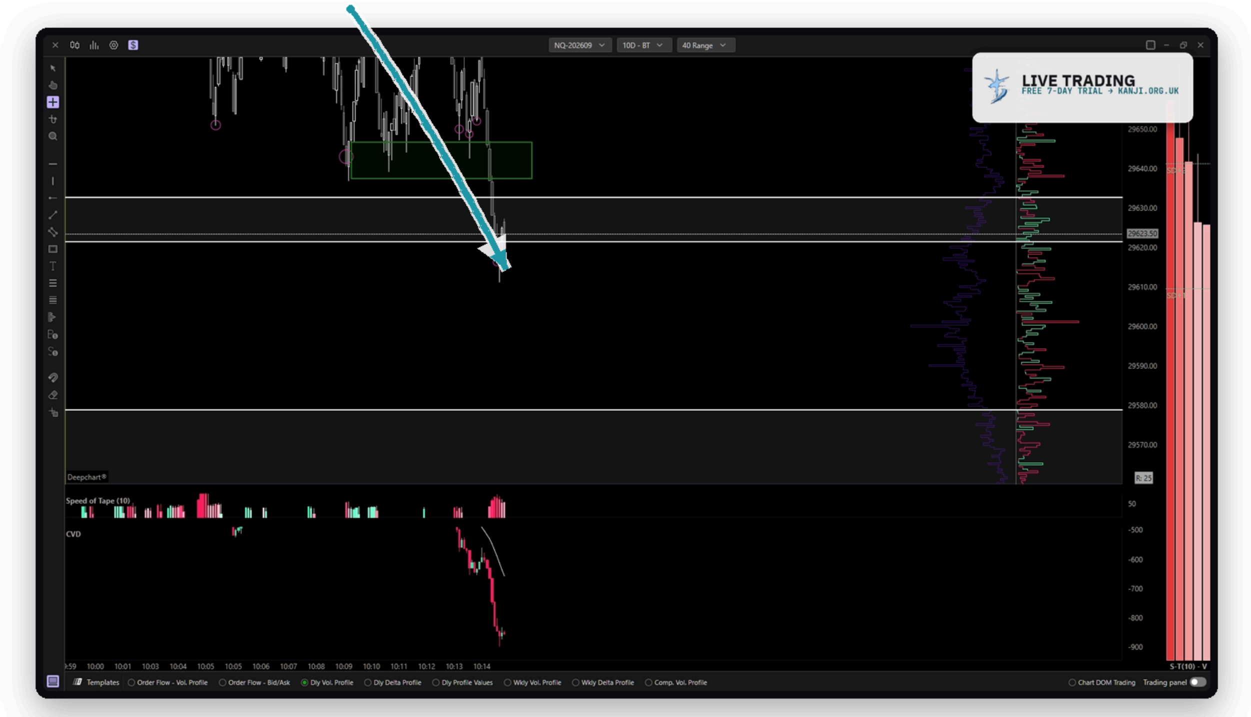
Trade 2: the loss

Before: a level that's already rejected sellers twice

third retest of the level, still no buyers stepping in



Price retests a level that had already rejected sellers twice. No buyers show up to defend it a third time.

Not every read works, and this one is in here because of that. Sellers had already hit this level twice with nothing to show for it: no buyers stepping in either time. On the third retest, still nothing, so the short went in: “I'm in these shorts with my stop just above, targeting this area, kind of low risk.”

Trade 2: the loss

After: stopped, before the move even develops

Stop sits just above, risk kept deliberately small. Price ticks back up through it before the actual move develops.

It got stopped. Low risk doesn't mean no risk, and a level failing to hold twice doesn't guarantee it fails a third time.

This is what separates a sound process from a guaranteed outcome. The read was reasonable given what was in front of me. The market just didn't cooperate. That's a real cost of doing this for a living, not a mistake to edit out of the video.

Knowing when a level is genuinely rejected versus about to fail a third time is a live-session skill, not a rule you can memorize. Covered in the free trial.

Trade 3: trailing convexity

Before: entry at R:R 0.69

Entry goes in at R:R 0.69, a small starting reward against the risk. Aggressive buying lines up right as the level confirms.

This is “trailing convexity,” one of the four models layered into the overall read, and it's easiest to see live rather than explained cold. The entry itself wasn't a high reward-to-risk trade on paper: R:R 0.69, meaning the initial target was smaller than the initial risk. Most traders would skip that outright.

Trade 3: trailing convexity

After: the same entry, now R:R 1.83

As price runs, the stop trails behind it instead of sitting fixed. By the time it's hit, the R:R on the same entry has grown to 1.83.

The difference is what happens after the entry. Instead of a fixed stop and fixed target, the stop trails behind price as it moves in my favor: “trailing convexity means I have to trail here, if we push up higher, I can trail again.”

Each trail locks in more of the move without capping how far it can run. By the time the trail was hit, the same entry that started at R:R 0.69 had become R:R 1.83, just from letting the stop do the work instead of a fixed target: “so this was a kg one retest trade with the trailing convexity, that's why I got out there.”

Trade 4: closing the day

Before: resistance, and the move is losing steam

Price stalls into a resistance level already marked out ahead of time. The move up is losing aggression candle by candle, not gaining it.

The last trade of the session, taken once the day's objective was already basically in hand: “I was ready above the objective I wanted for today.” The resistance level here had been marked out in advance, and the move into it was losing steam rather than accelerating, which is the tell I was waiting on, not just fading a level because it's a level.

Trade 4: closing the day

After: a small short, and the day is done

The short goes in against that resistance, risking about $100. It's the last trade of the day.

Risk was kept to about $100, deliberately small this late in the day with the objective already close. It hit, and that was the day: “above a hundred bucks of this hits, yeah, that is a model, all right, I am done for the day, I am up a 1k.”

Four trades shown here, three wins and a loss, netting a bit over $1,000 across six accounts. That's the honest version of what a professional session looks like: not zero losses, just a process that holds up across the losses too.

Reading where price sits in the higher timeframe auction, the thesis behind an objective like this one, is taught in the first two videos that unlock free in the trial.

Four trades. One process. Same read every time.

This is what the mentorship actually teaches: not a signal to copy, the reads themselves. Absorption, refill, reward vs result, trailing convexity, all of it. The free 7 day trial gets you the live sessions and the foundations to start reading it yourself.

If the loss in trade 2 put you off, that's the point. It should. This isn't a strategy that wins every time, it's a process that survives the times it doesn't.
