

@greenbirdtrader — complete union file

This single PDF is the union of (1) the distilled framework with every definition, (2) the raw archive of retrieved posts and his replies, (3) the cached chart images. Earlier 'complete' PDFs were NOT supersets of each other. This one is meant to be.

Still not a guaranteed 100% dump of every tweet since April 2025. X search caps results. Amen-only comments stay out. Model text, Q&A, and charts that were retrieved are in.

PART A — Distilled framework

Green Bird Trader (@greenbirdtrader) — Distilled Trading Framework

Source: Public posts and chart screenshots from x.com/greenbirdtrader, reviewed September 2026.

Who he is (from bio and posts): Futures trader focused on Nasdaq (NQ / MNQ). Aviation / EMS background. Documents live execution. Trades a fleet of copy-traded funded accounts (he has cited ~27-35 accounts plus live). Does not sell mentorships or a paid Discord. Motto: Calm Under Pressure.

Honest coverage note: X search does not return a guaranteed complete archive of every tweet and reply ever posted. This file is distilled from his highest-signal original posts, image posts, and replies that actually define the model (NYAM, Asia, golden pocket, PDL/PDH, midnight open, management). Banter, amen replies, and non-trading content were ignored. Where a term is used but never fully defined by him, that is marked.

This is not financial advice. It is a reconstruction of *his* stated playbook.

0. Canonical definitions

Every term is tagged:

- HIS WORDS — he typed it.
- HIS CHART — read off a labeled screenshot (True Day Open, AS.L, LO.L, NWOG, session boxes).
- INFERRED — not written by him; taken from where his boxes sit on the time axis. Not a tweeted law.

All clocks are US Eastern. His TradingView is ET.

Sessions and times

True Day Open (TDO) / midnight opening price — HIS WORDS + HIS CHART

He corrected a commenter: “No, midnight opening price.” Also: “Midnight opening price, mark it off on your chart daily” and “Right at Midnight TDO.” The chart label is True Day Open.

Definition: first print at 00:00 ET. One line. Confirmation he named: 5-minute close back through it after a sweep.

NYAM range — HIS WORDS

9:00-10:00 AM ET. “I wait until after 10AM. The 9 to 10AM range is established. No guessing beforehand.”

Cash open is 9:30. He also uses 9:30 manipulation (sweep below the open, reclaim, long toward discount, stops at those lows) as a *separate* trigger. Do not take the 9-10 failed-break idea at 9:45 — he called that early.

Previous-hour range — HIS WORDS + HIS CHART

The last completed 60 minutes. “Previous-hour highs get swept.” On 2-minute screenshots the grey/green box is that hour.

Asia range — HIS WORDS for meaning, HIS CHART for the clock

He never tweeted “Asia is X to Y.” He did say: “Asia session has a high and a low” and “Asia highs and lows are the edges of the table.”

Painted pink box labeled Asia, low tagged AS.L. On the 15-minute mobile chart (3 Sep) the axis is 6:00 PM — 9:00 PM — midnight (date change) — 3:00 AM — 6:00 AM. The pink box starts near 8:00 PM ET and ends at or just after midnight / TDO. After midnight the box is finished; the trade is sweep-and-fail of that finished box, often with a close back through TDO.

Copy-his-chart definition: Asia High / Asia Low = high and low of roughly 20:00-00:00 ET.

That clock is the same Asia window ICT-style accounts post (example: [Mr1CT, 9 Sep 2026](https://x.com/Mr1CT/status/2097576912906588550) — “Asia → 8:00 PM – 12:00 AM”). Green Bird did not quote that card. His painted boxes just land on it. Use 8pm-midnight as the working Asia range unless he publishes a different clock.

ICT card vs his actual usage — do not merge them

Clock on that ICT card	What Green Bird actually uses
Asia 8:00 PM – 12:00 AM	Matches his pink Asia box. Use this.
Daily True Open 12:00 AM	Matches his TDO / “midnight opening price.” Use this.
London 2:00 AM – 5:00 AM	He marks London High / LO.L and aims at them. He never typed 2–5. Clock is ICT-standard; the *levels* are his.
New York 9:30 AM – 11:00 AM	Not his measuring box. NYAM range is 9:00–10:00, traded after 10:00. He *has* said “9–11 AM EST hands down best time to trade” — that is the execution window, not the box he draws.
New York True Open 7:30 AM	Not found on his charts or tweets. Do not add a 7:30 line as if he uses it.
“Above the true opens = sells, below = buys”	Not his rule. He sells a failed breakout and buys a failed breakdown. TDO is confirmation + magnet, not a standalone long/short switch.

London — HIS CHART only

Labels LO.L (London Low) and has listed “Sweep of London High” as confluence. No start/stop tweeted. On the Asia-failure photo, LO.L sits after midnight, below Asia, above NWO.G. Use his drawn London lines. ICT’s 2:00–5:00 AM ET window is INFERRED, not his text.

NY cash open — HIS WORDS

9:30 AM ET. He will take “one short after the New York open” when midnight was swept and failed. That is an open reaction, not the wait-until-10:00 NYAM box. Both exist in his feed.

NWO.G print / Sunday Globex — HIS WORDS

“Sunday @ 6PM EST the market printed a fresh NWO.G.” Futures reopen Sunday 18:00 ET. That open versus Friday’s close is the weekly gap.

Levels on the chart

PDH / PDL — Previous Day High / Low. Extra confluence if today’s sweep takes them. Short after PDL sweep: “stops above PDL.”

AS.L / Asia High — low / high of the Asia box.

NWO.G / Weekly Opening Gap — HIS WORDS + HIS CHART

Friday close vs Sunday 18:00 ET open. Drawn as two lines labeled NWO.G. Unfilled gap = magnet. “Markets have a tendency to rebalance inefficiencies, so that immediately became my primary target.” He closes the trade when price tags the gap.

Golden Pocket, premium, discount

Golden Pocket — HIS WORDS, exact fib

“Measure the NYAM move from high to low, mark off the 50% and there is your discount zone. I use the 50%–61.8% fib retracement as my golden pocket zone, pretty common.”

Draw: impulse high → low (down move) or low → high (up move). 50.0 to 61.8 is the pocket. Location only. Entry still needs failure / 5-minute close / reclaim.

Stacked with the range model — HIS WORDS

“Golden pocket fib retracement + 10am hourly low reclaim — false breakdown is the perfect combo.”

“Higher timeframe bullish, simple fib retracement, lower timeframe failed breakdown of that level, reclaim and enter long, stop below the level.”

“Bearish continuation after NY 50% retracement, the lows were just waiting to get swept.”

Structure words

Sweep — price through a marked high/low. “A sweep alone isn’t my signal.”

Failed breakout — sweep of a high, cannot hold, back inside → short.

Failed breakdown — sweep of a low, cannot hold, reclaim → long.

Reclaim — back through the level and hold on the original side.

5-minute close — named trigger: “I wait for the 5 min close back below the PDL after sweeping above it... once closed below, low risk entry on any retracement with stops above PDL.” Also: “closed on the 5 minute below TDO.” Then “wait a few points.”

9:30 manipulation — “9:30am manipulation below, reclaim, enter for longs targeting retracement into discount, stops at lows.”

Path of least resistance — HTF lean; on chop he only faded the heavy side.

Bodies vs wicks — “The bodies tell the story. The wicks do the damage.” Wickless low = “super sus.”

A+ — must include a sweep of the range. No sweep = not A+.

Invalidation — beyond the sweep wick or beyond the pocket. Tickets: ~17–20 pts tight, ~32–50 pts NYAM/PDL.

Partials — every 25 points, then stop to breakeven, runners on. First target = other side of the box, or NWOOG / PDL.

Base hit — 20–30 pt scalps, no A+.

Average up, not down.

DLL — daily loss limit; that funded account is done for the day.

Scratch — flatten near breakeven on purpose.

Size

Talks in NQ points, charts MNQU (\$2/pt). Named size: 2–4 MNQ one-and-done; 2–7 MNQ light into FOMC. P&L cards = fleet totals (30–35 copies).

0b. The one-sentence model

He trades failed breakouts and failed breakdowns of a session or hour range.

He does not buy because price is cheap or sell because price is expensive.

He buys because a breakdown failed. He sells because a breakout failed.

He calls this “playing ping pong with the market maker.” The edges of the table are session highs and lows. He waits for price to poke one edge, fail, and come back inside — then he aims at the opposite edge.

“I didn’t short because price was high. I shorted because the breakout FAILED.”

“I’m not buying because price dropped. I’m buying because the breakdown FAILED.”

“This is my primary model. I use it for all the sessions highs and lows.”

“ONE MODEL FOR LIFE.”

1. Absolute beginner glossary

Read this first. Every later rule uses these words.

Term	What it means in plain language
NQ	Nasdaq-100 futures. The big contract. \$20 per 1.00 point.
MNQ	Micro Nasdaq-100 futures. Same chart, 1/10 the size. \$2 per 1.00 point. Most of his screenshots are MNQ.
Point	On NQ/MNQ, 1.00 on the price (e.g. 29,560 → 29,561). He often talks in “25 points,” “100 points,” “150 points.”
Futures session / Globex	Index futures trade nearly 24 hours Sunday–Friday. “Overnight” and “Asia” happen while US stocks are closed.
NY open / NYAM	New York cash open is 9:30 AM Eastern. NYAM = New York morning. His core morning box is 9:00–10:00 AM Eastern.
Asia session	Overnight Asia hours. He treats Asia high and Asia low as the two edges of that session’s range. Exact clock times are not published in the posts reviewed; he just marks the session high/low on the chart.
Range	The high and low printed during a defined window (9–10 AM, previous hour, Asia, previous day).
Sweep	Price briefly trades beyond a high or low (takes the stops sitting there) and then comes back. A wick through the level is typical.

Liquidity	Clusters of stop-loss orders. Above an obvious high = buy-side liquidity (stops of shorts). Below an obvious low = sell-side liquidity (stops of longs). A sweep “grabs” that liquidity.
Failed breakout	Price goes above a range high, cannot stay there, and closes/falls back inside the range. That failure is his short.
Failed breakdown	Price goes below a range low, cannot stay there, and closes/rallies back inside the range. That failure is his long.
Reclaim	After going outside a level, price trades back through it and holds on the original side.
PDH / PDL	Previous Day High / Previous Day Low. Yesterday’s session high and low. Extra confluence if today’s sweep also takes PDH or PDL.
Midnight opening price / TDO / True Day Open	Charts label this line “True Day Open.” He also says “midnight opening price, mark it off on your chart daily.” Same line. A 5-minute close back through TDO is a named confirmation (e.g. sweep Asia high, then 5m close below TDO = short).
Golden pocket	His 50%–61.8% Fibonacci retracement of a measured move (he explicitly said: measure the NYAM move high-to-low, mark 50%, use 50–61.8% as the golden pocket / discount zone). Very common fib zone; he uses it as a *location*, not a standalone signal.
Premium / Discount	In an up-move, above 50% of the range is premium (expensive); below 50% is discount (cheap). He wants shorts from premium and longs from discount when bias agrees.
Bias	Higher-timeframe lean: is the day/session more likely up or down? Built from structure (e.g. PDL swept and reclaimed overnight → bullish into NYAM).
Confluence	Stacked reasons. “Everything in trading is a matter of confluence. You’re always scoring and rating a setup. More confluence = higher rating.”
A+ vs B+	A+ includes a sweep of the range. He told a follower a setup was not A+ *specifically because there was no sweep*. B+ setups are “not easy to trade.”
Invalidation	The price that proves the idea wrong. Usually beyond the sweep extreme (above the swept high for a short; below the swept low for a long). Stop goes there.
Partial / runner	Take some contracts off at a target; leave some on (“runners”) for the bigger move. After first target, stop goes to breakeven.
Base hit	Small, clean win (he cites 20–30 point scalps on non-A+ days) instead of swinging for a 100+ point “banger.”
Copy-traded / fleet	One execution copied across many funded accounts. His posted dollar P&L is often combined across the fleet, not one account.
Tradesyncer	The copy-trading “cockpit” he uses (flatten-all / kill switch when done).
SMT	Smart Money Technique / intermarket divergence. He said he is “not big on that SMT train” and did not find an edge.
Order flow (DOM, footprint)	He is skeptical for retail: he has “yet to see a proven documented strategy for a retail trader that’s profitable using order flow.” He trades time + price + location on the chart.
NWOG	New Week Opening Gap (also “Weekly Opening Gap”). The gap created when Sunday Globex opens vs Friday’s close. He treats unfilled NWOG as a magnet / primary target. “Markets have a tendency to rebalance inefficiencies.” One Monday short: sweep midnight → fail → close the whole trade when price hits NWOG. NWOG prints Sunday ~6:00 PM ET.
London high / low	Another session edge. On a textbook short he stacked: sweep of PDH + Asia high + London high, then failed breakout, then bearish structure shift, target = NWOG.
DLL	Daily Loss Limit on funded accounts. Hard stop for that account for the rest of the day. He has blown 20 Apex accounts into DLL in one morning and still calls DLL a feature, not a bug: it stops the spiral.
Bodies vs wicks	“The bodies tell the story. The wicks do the damage.” He does not get shaken out by stop-hunt wicks if the candle bodies still support the idea. A wickless bottom he called “super sus” (suspicious — likely absorption / unfinished business, not a clean sweep).
Scratch	A trade exited near breakeven on purpose. Pre-FOMC example: 5 trades = 3 scalps + 2 scratches.

2. Markets, platform, and time

- Instrument: Nasdaq futures. Charts shown as MNQU (Micro NQ). Narrative is in NQ points.
 - Platform visible on screenshots: TradingView charting + Tradovate execution. Session shading labeled “NY.” Watermark “Green Bird.”
 - Clock: Eastern Time on the charts (e.g. 9:00–10:00 AM, 10:30 AM live streams).
 - When he trades:
 - NYAM model after 10:00 AM ET (range must finish first).
 - Asia / midnight shift overnight (he has posted large combined P&L “before 2 AM”).
 - Sometimes previous-hour ranges, not only 9–10.
 - Sometimes PM session if an A+ false breakout appears later (one recap: three morning stops, then a PM false breakout that saved the day).
 - When he often stops:
 - After the morning objectives / “locked out by noon.”
 - After locking accounts overnight (“Discipline > greed. See you tomorrow for NYAM.”).
 - He once said “I’m glad I don’t trade Fridays” as a personal risk rule, then still posted Friday setups other weeks. Treat “no Fridays” as a *preference*, not a hard law in every period.
 - News stance: He does not predict CPI / Fed / headlines. News creates volatility; price creates the trade. On a CPI day he built bias *the night before* from a PDL sweep-and-reclaim, then bought pullbacks. He has also held an overnight winner into CPI with a trailing stop (“CPI came in and finished the job”) rather than flattening before the number.
 - Do not enter the NYAM idea before the box exists. He documented a \$12K day where the mistake was entering at 9:45 AM. After 10:00 the A+ confirmed and paid. “Most traders lose because they rush.”
 - Sunday Globex is a real session for him (250-point longs, accounts then locked until 10:00 AM Monday).
 - Typical per-account size shown in text (not a law): 2–4 MNQ on a clean one-and-done day; 2–7 MNQ when he is “coming in light” into FOMC. Fleet size cited over time: ~19 → 27 → 31 → 33 → 35 copy accounts.
-

3. The primary playbook: failed breakout / failed breakdown

This is the model he repeats until it is almost a template.

3.1 Build the box (do this first — no trade yet)

1. Pick the range you will use:
 - NYAM default: 9:00–10:00 AM ET.
 - Asia default: Asia session high and Asia session low.
 - Portable version: previous hour high / previous hour low (he has said “previous-hour highs get swept”).
 - Daily context lines: PDH, PDL, midnight open / TDO.
2. Wait until that window is closed.

For NYAM: “I wait until after 10 AM. The 9 to 10 AM range is established. No guessing beforehand.”
3. Draw:
 - Range high
 - Range low
 - Any bonus levels that sit near those edges (PDH, PDL, midnight open)

You now have a box. You do nothing inside the box until one edge is attacked.

3.2 The short (failed breakout)

1. Price sweeps the range high (and ideally also PDH if it is nearby).
2. Breakout traders get what they wanted — a new high.
3. Price cannot hold above the high.
4. Price falls back inside the range.
5. Confirmation he has named: a close back below the level — on at least one example, a 5-minute close below TDO after the Asia-high sweep. On a PDL-sweep short: “The key for me is getting a 5 min close below, once I got it I waited a few points and entered short.”

6. Enter short after that failure, not on the first tick above the high.
7. Stop: above the sweep wick / above the invalidation (he has said “stop right above PDL” when PDL was the swept level).
8. First target: the low of the same range.
9. After first target: take partials, move stop to breakeven, leave runners toward lower objectives (session low, measured move, next liquidity).

3.3 The long (failed breakdown)

Exact mirror.

1. Wait for the range to exist (after 10 AM for NYAM).
2. Price sweeps the range lows.
3. Price fails to stay below them.
4. Price reclaims the range.
5. Extra confluence example he posted: the sweep also took previous day’s low.
6. Enter long on the failed breakdown, not because “it dipped.”
7. First target: range highs.
8. Partials, stop to breakeven, runners.

3.4 What is **not** a signal

- A sweep alone. “A sweep alone isn’t my signal. I’m watching what happens AFTER it. Does price hold above the Asia highs, or fail back inside?”
- “Price is high” or “price is low.”
- Predicting the next direction of NQ.
- Indicators, Discord calls, SMT, retail order flow.

3.5 Grading the setup

He scores setups. Reconstructed grading from his own words:

Grade	What he has actually required
A+	Sweep of the relevant range plus failure back inside. Often also HTF bias, a 5-minute close beyond a key line (range / TDO / PDL), and a tight invalidation. He has called the stacked version “structure + liquidity + retracement + failure.”
Bonus confluence (raises the grade)	Simultaneous sweep of PDH or PDL; close beyond midnight open / TDO; golden pocket location; multi-timeframe agreement; already-bearish or already-bullish day.
B+	Directional idea without a range sweep. He said B+ is not easy to trade. On those days he shrinks size and takes 20–30 point scalps instead of hunting 100+ point A+ runners.
No trade	Range not finished. Sweep but price holds outside (true breakout). No close back inside. No clear invalidation.

4. Second model: Golden Pocket continuation / reaction

Same philosophy (location → wait for failure → execute), different measuring stick.

How he defines the zone

“Measure the NYAM move from high to low, mark off the 50% and there is your discount zone. I use the 50%–61.8% fib retracement as my golden pocket zone, pretty common.”

So:

1. Identify a completed impulse (e.g. NYAM high-to-low on a bearish day, or a larger HTF swing).
2. Draw Fibonacci from the start of that impulse to the end.
3. The 50–61.8% retracement is the pocket.
4. On a bearish day that pocket is a short location (retracement into premium/mid).

5. On a bullish day it is a long location (retracement into discount).

What he waits for *in* the pocket

Not a blind limit at 61.8%.

From July 30 posts:

- Higher-timeframe bias first ("higher time frame bearish").
- Price retraces ~50% into the golden pocket.
- Clean rejection / failure to continue through the zone.
- Then the trade.
- Invalidation: above the zone for a short.
- Once in profit: stops to breakeven, partials along the way.

He summarized the whole thing as four words:

Bias. Location. Confirmation. Execution.

A fully stacked short he called "picture-perfect Green Bird":

1. Bearish day
2. Retracement ~50% into the golden pocket
3. Sweep above PDL
4. Failure
5. Short, stop just above PDL, target the lows

That is the range-failure model plus the fib location.

Premium / discount reminder

- Longs: he wants the pullback in discount (at/below 50% of the bullish range).
- Shorts: he wants the bounce in premium (at/above 50% of the bearish range).
- Golden pocket sits on that 50-61.8 band.

5. Context lines he wants on the chart every day

Mark these before the session. He treats them as "watch the magic" levels, not automatic entries.

1. Previous Day High (PDH)
2. Previous Day Low (PDL)
3. Midnight opening price / TDO — "Mark it off on your chart daily."
4. Asia high and Asia low (for overnight / next morning context)
5. 9:00-10:00 AM ET high and low once that hour has closed
6. Optional: previous hour high/low if you are trading later hours
7. Optional: event boxes he has drawn live (CPI high / CPI low)
8. Fib 50% and 61.8% of the session or impulse you are using

A reclaim of PDL overnight is, in his words, "one of the cleanest Green Bird entry models" and can create the next day's bias (get long overnight, buy pullbacks in NYAM).

6. Timeframes

He is not a one-chart scalper with no context.

Observed / stated:

- Execution chart on screenshots: 1-minute and 5-minute MNQ.
- Confirmation he verbalized: 5-minute close back through the level (below TDO, below the swept high, etc.). After the close he may "wait a few points" then enter.
- Bias: higher timeframe (he says "higher time frame bearish/bullish" and "multi timeframe confluence"). He has not pinned a single HTF (no "only use the 1H").

- Session boxes on the chart are time-based highlights (NY shade), not indicators.

Practical stack a beginner can copy from his process:

Layer	Job
Daily / prior day	PDH, PDL, bias from sweep-and-reclaim
Session	Asia H/L, NY 9-10 box, midnight open
5-minute	Close that confirms failure
1-minute	Fine entry after the 5-minute close

7. Entry, stop, target, management — the mechanical rules

Pulled only from things he has written or shown on tickets.

Entry

- After failure + reclaim, not during the sweep.
- Preferred confirmation: 5-minute close back inside / back beyond TDO or PDL.
- Then a small wait (“waited a few points”) rather than chasing the close tick.
- He strikes when the A+ picture is there. “When you see your setup, you gotta act. No hesitation.”
- He does not need the market to make a brand-new high for a short if the failure already happened at the level (he challenged a comment with “How? It never made a new high?” — meaning the *hold* above matters more than a literal new high label).

Stop / invalidation

- Beyond the sweep extreme or beyond the zone.
- Examples from posts: stop right above PDL on a PDL-sweep short; “clearly defined invalidation above the zone” on a golden-pocket short.
- Screenshot tickets (illustrative, not a fixed formula):
 - Long after NYAM low sweep: stop ~32.5 points below, first targets stacked above, R:R shown ~6.7.
 - Short after 9-10 high sweep: stop ~34.5 points above, targets down toward PDL, R:R shown ~8.7.
 - Golden-pocket / PDL short: stop ~49.75 points above PDL, R:R shown ~4.2.
- After first objective pays: stop to breakeven. “Risk removed.” “From that point on I had already guaranteed myself a green trade no matter what happened next.”

Targets

- First objective = opposite side of the range you used.
 - Short the 9-10 high failure → first target is the 9-10 low.
 - Long the 9-10 low failure → first target is the 9-10 high.
 - Asia high failure → target Asia low.
- Then runners toward next liquidity (session low/high, PDL, measured extension).
- Partials every 25 points (stated on the Sep 8 NYAM long).
- He will take partials *instead of* waiting for the entire theoretical move. “I took partials rather than waiting for the entire move.”
- Limit orders on screenshots are often parked in a ladder (~25-40 point spacing), matching the 25-point partial rule.

Position sizing and “pressing”

- A+ day: full conviction, can look for 100-200 point swings, runners on.
- No A+ / messy day: stay small, 20-30 point scalps, no reason to size up. “Green is green.”
- Winners: he learned to add to winners (average up, not down). “I don’t average down. I average up.”
- After the plan is paid: flatten / lock accounts. Kill switch in Tradesyncer. “There comes a point where enough is enough.”
- Combined-fleet P&L numbers are marketing-noisy. For *rules*, ignore the dollar figure; keep the structure.

What a typical ticket looks like on his screenshots

- Session box shaded (green/grey “Green Bird” watermark).
 - Sweep wick marked through the box edge, often with a small “NY” tag at the session boundary.
 - Red stop box beyond the wick.
 - Green target box toward the other side of the range / next level.
 - Multiple limit exits in a column.
 - Open P&L, R:R, and contract quantity on the position bubble.
-

8. Session-by-session recipes

A. NYAM (his flagship)

After 10:00 AM ET

9:00–10:00 range is complete

IF price sweeps 9–10 high

AND fails / closes back inside

AND (bonus) also swept PDH

THEN short

stop = above sweep

T1 = 9–10 low

partials every ~25 pts

stop → breakeven

runners lower

IF price sweeps 9–10 low

AND fails to stay below / reclaims range

AND (bonus) also swept PDL

THEN long

stop = below sweep

T1 = 9–10 high

same management

He has printed this as a numbered checklist (Aug 28):

1. Wait for 9:00–10:00 to close.
2. Wait for a sweep of the 9–10 highs (bonus: PDH).
3. Watch the breakout fail — clean rejection, back into the range.
4. Strike the short. First objective = low of 9–10. Then runners, stop to BE.

B. Asia / midnight

Mark Asia high, Asia low, midnight open

IF Asia high is swept

AND price closes back below (ideally also below midnight open / TDO on the 5m)

THEN short toward Asia low

IF Asia low is swept

AND failure back inside

THEN long toward Asia high

Same ping-pong sentence: “Asia highs and lows are the edges of the table. I wait for price to sweep one side, fail back inside, then trade the reversal toward the opposite edge.”

C. Previous-hour version

Identical logic on the last completed 60-minute box. He has taken two NYAM shorts in one morning this way: first hour high swept and failed (~50 pts), then the market “served it up again” (~100 pts).

D. Trend day / news day overlay

If overnight already did the clean reclaim (e.g. PDL swept and held):

- Bias is set.

- During NYAM he buys pullbacks into discount / golden pocket rather than only fading a fresh range.
- He still uses the 9-10 and 10-11 ranges as structure.
- He does not fade the trend just because a headline printed.

E. “Not my A+” day

- Keep the bearish or bullish lean.
 - Take small 20-30 point scalps only.
 - Do not force a 100-point narrative.
 - Close the screens. Tomorrow exists.
-

9. Psychology and operating rules (he repeats these as much as the setup)

These are part of the model, not decoration.

1. One model. “Stop collecting strategies. Master one.” “I don’t wake up looking for trades. I wake up looking for *my* trade. If it appears, I strike. If it doesn’t, I wait.”
 2. Process over prediction. Screenshots > opinions. “The screenshots tell the entire story.”
 3. Survive to the A+. Three stops in the morning do not invalidate the fourth setup. “Take the papercuts. Protect the capital.”
 4. Boredom is the enemy. The dangerous day is the green-but-ugly day when tilt wants more size.
 5. Done means done. Flatten all. Lock accounts. Don’t look until the next session.
 6. Base hits scale. “You do not need to trade all day. You do not need to catch every move.” A few clean trades + copy size = the big dollar screenshots.
 7. Document losers too. “Every trade documented. Good, bad, or ugly.”
 8. Calm under pressure is the brand because his other job (aviation / EMS) is the metaphor: slow is smooth, smooth is fast.
 9. No heroics on news. Volatility is a gift only if the level and failure already exist.
 10. Teach recognition, not calls. “The goal is for you to recognize the next one yourself.”
-

10. What he explicitly does *not* use

- SMT as an edge
 - Retail order-flow as a standalone strategy
 - A stack of indicators
 - Paid signals / Discord calls as the source of trades
 - Averaging down
 - Predicting CPI / speakers / headlines
 - Needing 47 strategies
 - Treating a sweep as an automatic entry
-

11. Beginner checklist (print this)

Night before / Sunday plan

- [] Mark PDH, PDL, midnight open
- [] Note Asia high / Asia low as they form
- [] Write a one-line bias only if a clean sweep-and-reclaim already happened

NY morning

- [] Do not trade the 9:00-10:00 box until it is closed
- [] After 10:00, only act if one side is swept and fails back inside
- [] Prefer a 5-minute close through the level, then enter a few points later
- [] Stop beyond the wick

- [] First target = other side of the box
- [] Partial every ~25 points
- [] Stop to breakeven after first target
- [] If no sweep, it is not A+. Stay small or stand down

Anytime (Asia, PM, next hour)

- [] Same four steps: box → sweep → failure → other side
- [] Extra points if midnight open / PDH / PDL / golden pocket agree

End of mission

- [] Flatten
- [] Screenshot the chart the way he does (box, sweep, stop, targets)
- [] Do not invent a second model because you are bored

12. Worked examples from his own posts (compressed)

Sep 8, 2026 — NYAM long (“ONE MODEL FOR LIFE”)

Waited until after 10. 9–10 range set. Swept the lows, failed to stay below, reclaimed. Also swept PDL. Long. Targets = range highs. Partials every 25 points. Overnight he had already faded a failed Asia-high breakout. Same model, both sides of the table.

Sep 8, 2026 — Asia short (~2 AM)

Asia highs swept, breakout failed, price back inside. Short. 100+ points. Partials off, runner toward session lows. Combined fleet P&L posted; rule is the failure, not the dollar figure.

Aug 28, 2026 — NYAM short

Numbered 4-step NYAM short. Sweep of 9–10 highs + PDH. Failure. Short to 9–10 low, then runners. Chart: 1-minute MNQ, stop above the sweep, buy-limit ladder underneath toward PDL.

Aug 27, 2026 — two previous-hour shorts

Previous-hour high sweep → fail → short. +50, runners stopped. Same structure again for +100. “2/2 today.”

Sep 1, 2026 — golden pocket + PDL short

Bearish day, ~50% retrace into golden pocket, sweep above PDL, fail, short, stop above PDL, target lows. He later spelled the entry trigger: 5-minute close below, wait a few points, sell.

Sep 2, 2026 — no A+ day

Made money anyway with 20–30 point shorts, small size, screens off. Explicitly *not* the sniper model.

Jul 14, 2026 — CPI trend day

Bias from *overnight* PDL sweep and reclaim. Long overnight. NYAM: buy pullbacks / golden pockets / sweeps in the direction of that reclaim. Average up, not down.

Jul 30, 2026 — HTF + golden pocket short

HTF bearish, 50% retrace into pocket, rejection, ~200 point short, stop above zone, BE once working. “Just time, price, location, and patience.”

13. Business / ops context (not the edge, but it is in the tweets)

- Prop / funded fleet (MyFundedFutures mentioned; trailing drawdown on daily funded accounts is a constraint he has complained about).
- Copy trading via Tradesyncer across Tradovate / Rithmic / DXFeed / personal.
- Live streams (Victory Room / friend’s Discord; “people who watch the livestream always see it first”).
- Payout screenshots and combined P&L are part of the account brand. Treat them as *his results claim*, not as a rule of the model.
- Compliance / broker emails have appeared; irrelevant to the chart rules.

14. Gaps — things he uses but did not fully specify in text

Do not invent precision he did not publish.

Topic	Status in the public posts reviewed
Exact Asia session clock (e.g. 7 PM-3 AM ET)	Not stated; he only says "Asia high / Asia low."
Formal definition of TDO vs midnight open	Used interchangeably in practice; not defined in a glossary post.
Exact 5-minute close rule vs 1-minute entry	5-minute close is the confirmation he has *named*; 1-minute is what many screenshots show.
Fixed risk % per trade	Not published. Stops are structure-based (beyond wick/zone), size depends on A+ vs B+ and fleet rules.
Whether Friday is always off	Contradictory across months. Personal filter, not a core law.
Full historical tweet-by-tweet archive	Not recoverable from search in one pass. Oldest material and low-engagement replies will be missing.
PMO	One reply said "PMO for the win" with no definition. Do not guess.

15. How to study his screenshots (low-contrast charts)

His charts are the syllabus. When you open one, read in this order:

1. What box is shaded? (9-10 NY, Asia, previous hour)
2. Which side was wicked through? That is the sweep.
3. Did the body close back inside? That is the failure.
4. Where is the red stop box? That is invalidation.
5. Where is the first green target? Almost always the other side of the box or PDL/PDH.
6. Are there stacked limits every ~25 points? That is management.
7. Is there a fib 50-61.8 band? Then it is the golden-pocket variant, not a different strategy.
8. Is PDH/PDL/midnight drawn through the sweep? Extra confluence, same trade.

If you cannot read a washed-out screenshot, those eight questions still decode it.

16. What the screenshots add that the captions hide

Read off the actual chart images, not the P&L cards.

Chart anatomy (repeated across months)

- Product: MNQU (Micro Nasdaq), TradingView, often 1m or 5m.
- Session paint: green/grey "Green Bird" box on the 9:00-10:00 (or prior hour) window; a separate pink "Asia" box overnight.
- Horizontal lines labeled in the UI: True Day Open, PDH, PDL, AS.L (Asia low), sometimes THURSDAY session separators.
- Position ticket: red stop box beyond the sweep, green target box toward the opposite edge or PDL/NWOG, R:R often printed 4R-8R.
- Stops seen on tickets: ~17 pts (tight Asia short above TDO), ~32-35 pts (NYAM), ~50 pts (PDL sweep short). Not a formula — structure.
- Partial ladder: sell/buy limits stacked ~25-40 points apart.
- Mobile chart (Sep 9 "cleaner than this"): 5-minute MNQ. Price swept a morning high near True Day Open, failed, sold down through the NY box toward PDL. Same model on a phone.

Hidden rules visible only when you look at the picture

1. TDO is drawn as a dotted/solid price line through the session, not just mentioned. Failures that close back through TDO on the 5m are the ones he screenshots.
2. Asia box is a full overnight rectangle with AS.L marked at the bottom. Shorts after sweeping the top of that box aim at AS.L.
3. He will take the short even if the wick never makes a dramatic "new high" label — he argued with a commenter on this. The failure relative to TDO / range matters more than a new-high sticker.

4. NWOOG is a destination, not an entry. July 27 checklist from the chart-and-caption pair:

- Large weekly opening gap sitting below price → that is the target first.
- Then wait for stacked sweeps: PDH + Asia high + London high.
- Failed breakout back below those highs.
- Bearish market structure shift.
- One trade to the gap. Close when the gap is tagged. One and done.

5. Monday = NWOOG day. Two consecutive Mondays he posted the same weekly-gap short (~300 points each). Sunday 6 PM ET is when the fresh NWOOG prints.

6. Bodies vs wicks is an execution filter. He trails overnight longs through messy wicks if bodies keep printing in his direction. He does not treat every wick as invalidation.

7. P&L screenshots are fleet totals. \$81k / \$86k cards say “across 33–35 copy traded accounts,” ~\$3.0k–\$3.6k per account that day. Do not read those as single-account results.

17. Extra operating rules found only by paging older original posts

These did not show up in the recent viral threads.

Rule	How he actually said or showed it
Wait until after 10:00 for the NYAM A+	Entered 9:45 once, called it early; A+ paid after 10:00.
One high-quality trade can be the whole day	“+\$41,307 before lunch. 33 accounts. One clean 100 point trade. That’s it.” Also: 30 minutes, 2–4 MNQ, short to NWOOG, lock out.
Pre-event days = shrink	Pre-FOMC: “lower expectations, tighter risk,” 2–7 MNQ, scalps and scratches, one hour, done.
Daily loss limits are part of the system	Apex DLL stopped 20 accounts; he still posts the red. “Old Green Bird would’ve tried to fight the market. New Green Bird shuts the screens.”
Never hold a loser because “it’ll come back”	–\$83k tilt day: “I could not bring myself to close a losing trade... I was trading my ego.” Named as discipline failure, not strategy failure.
After a red day, do less	“Now comes the hardest part... Doing nothing.” Protect overnight recovery; don’t size up to get even.
Leave untouched the accounts that already won overnight	On a hosed NYAM he left the strong overnight accounts alone and only worked accounts still available.
Trail + trim overnight, don’t babysit every tick	Asia long: lock 50–100 points, stop to BE, “let’s see if they run it or take out my stops, either way I’m going home with money.” Then trail into NY/CPI.
Sunday night is in play	Globex long 250+ points, lock accounts until 10:00 AM Monday.
Chop days grind even good traders	Stand-alone reply; matches the “no A+ → 20–30 pt scalps or flat” rule.
Wickless bottoms are suspicious	“That’s wickless bottom is super sus.”
He livestreams the process	Kick: kick.com/thegreenbirdshow. Also friend’s Victory Room Discord. OBS failures get posted; he does not only post winners.

18. Coverage reality (so this file is not pretending)

What was actually walked:

- Original (non-reply) posts from Feb 2026 through 9 Sep 2026, paged in date windows, plus image-only and term-specific passes.
- Replies that contained rules (TDO close, 5m close, golden pocket definition, A+ vs no-sweep, SMT rejection, order-flow skepticism, midnight open).
- Chart images from the main model posts (NYAM long/short, Asia short with TDO/PDH/AS.L, PDL golden-pocket short, mobile 5m failure).

What still cannot be claimed:

- A literal 100% scrape of every reply and every low-view quote-tweet. X search returns a cap per query; quiet amen-replies and deleted posts will be missing.
- Exact Asia clock start/end. The Asia *box* is on the chart; the clock is not written out.

- A single published risk-percent. Size is described as 2-7 MNQ per account and “stay small on B+ days.”
 - Whether NWO, NYAM range-fail, and golden pocket are three models or one model with three measuring sticks. He calls all of them “the same Green Bird playbook.” Treat them as one failure-after-sweep engine aimed at the next inefficiency (range opposite, PDL/PDH, or NWO).
-

18. Last three months — deep pass (Jul-Sep 2026)

Week-by-week originals plus the attached charts. Only listing what this pass added or confirmed in the pictures.

Chop with one-way pressure (20 Aug) — 2-minute chart

Two NY boxes (9-10 and 10-11). The chart is covered in red arrows on failed highs and blue arrows on covers. Caption: only shorts because “shorts are still the path of least resistance.” No longs, no bottom-calling. Hidden rule: on a grind day he will repeat the fade at every clean pop instead of waiting for one 100-point A+. That is how a “disgusting” chart still booked ~\$78k across 32 accounts.

NWO Mondays (27 Jul, 3 Aug, 17 Aug)

Sunday 6:00 PM ET prints the weekly opening gap. He shorts a failed midnight / NY-open sweep with the gap sitting underneath as the draw, then closes the whole trade when price tags NWO. Size shown: 2-4 MNQ per account, ~30 minutes, lock out by 10 AM. Same short two Mondays running (~300 pts each).

Trail the flight (12 Aug)

Long built in Asia with zero drawdown, then he kept moving the trailing stop and let NY + CPI finish it (260+ pts). “Bodies tell the story. The wicks do the damage.” Same day he also took the NYAM failed-breakdown long and pressed because the model kept printing.

One-and-done (13 Aug)

One 100-point trade, a couple of contracts, copy to 33 accounts, lock out. Overtrading *after* the A+ pays is the leak he keeps warning about.

Previous-hour short ticket (27 Aug, 2-minute)

Completed-hour box, sweep of the hour high, fail, short. Stop 19.25 points above the wick, R:R printed 9.66, buy limits ladder toward PDH. True Day Open drawn through the middle — he is selling *back through TDO* toward PDH. “Round three” the same day = same short taken again after the tape rebuilt a high and failed it.

Process from this window only

- Vacation is part of the year (“key to a successful trading year”); he also said daily livestreaming is draining.
- “If you’re actually a consistently profitable trader you shouldn’t be blowing accounts ever, even prop firm accounts.”
- OPEX week: traders get chopped unless they already know what they are waiting for.
- Separate swing account for cash names — not the day model.
- Incentive filter for new traders: affiliate-code accounts may be a funnel; demand red+green receipts.
- Midterm-year arguments with other accounts are not execution rules. The tape rule stayed path-of-least-resistance + failure of the box.
- Jul 25-15: six-figure holes, 20-25 Apex DLLs, then Asia recovery on the model only. Overnight winners left untouched while he worked the damaged book.

Compiled from public X posts and attached charts of @greenbirdtrader. Reconstructs his stated rules for study. Not a signal service and not a claim that the model is complete, unique, or profitable for anyone else.

PART B — Raw retrieved posts and replies

@greenbirdtrader — raw post archive (agent / LLM readable)

```

How an agent should read this file

- Each record is a fenced RECORD block with stable fields.
- type is original or reply.
- url is always <https://x.com/greenbirdtrader/status/{id}>.
- conversation_id groups a parent tweet with his replies under it.
- media lists remote pbs.twimg.com URLs. If a file was downloaded, local is set.
- Quoted tweets are nested under quoted.
- His own answers to commenters are separate reply records with the same conversation_id.
- Do not treat P&L dollar figures as rules. They are fleet totals.

Coverage (read this before claiming completeness)

X search returns a cap per query (here: 10). Thread fetch returns a sample of replies, not every comment.

This file is not a guaranteed 100% dump of every post since April 2025. It is the raw text + media URLs retrieved across date-window paging from 2025-04 (account birth) through 2026-09-10, plus full author-reply chains on the model-defining conversations.

What is in this file:

- Model-defining originals (NYAM, Asia, golden pocket, NWOOG, TDO, risk).
- His replies that define terms (TDO = midnight, golden pocket = 50-61.8, 5-minute close, etc.).
- Earlier vocabulary (2025): sweep → reclaim → opposing liquidity, PWH, MSS+FVG, Opening Range.
- Ops / psychology originals that constrain how he trades (no payout-pending accounts, DLL, no Friday preference, overtrading).

What is out / incomplete:

- Amen replies (“Beautiful”, “My pleasure”).
- Most other people’s comments (only kept when needed to understand his answer).
- Deleted posts.
- Quiet low-view replies the search index did not return.

To extend: page from:greenbirdtrader since:YYYY-MM-DD until:YYYY-MM-DD in ~7-day windows, both with and without -filter:replies, then conversation_id:{id} from:greenbirdtrader on any original with replies > 5.

A sweep alone isn't my signal.

I'm watching what happens AFTER it. Does price hold above the Asia highs, or fail back inside?

On this trade, the failure gave me the short. The session lows gave me the objective. I took partials rather than waiting for the entire move.

ONE MODEL FOR LIFE.

Green Bird NYAM. Same playbook, this time long.

I wait until after 10AM. The 9 to 10AM range is established.

Price sweeps the lows. Fails to stay below them. Reclaims the range. That's my long.

Bonus today: we swept the previous day's low too.

Target the range highs. Take partials every 25 points. Move stops to breakeven and let the remaining contracts work.

I'm not buying because price dropped. I'm buying because the breakdown FAILED.

Overnight I traded the failure above Asia highs. This morning, the failure below the NYAM lows.

Clean sweep above the PDL and failure back down for a beautiful low risk short entry targeting the lows.

The key for me is getting a 5 min close below, once I got it I waited a few points and entered short, hope this helps

Phrase bank for retrieval (his words only)

- "I didn't short because price was high. I shorted because the breakout FAILED."
- "I'm not buying because price dropped. I'm buying because the breakdown FAILED."
- "This is my primary model, I use it for all the sessions highs and lows"
- "ONE MODEL FOR LIFE"
- "A sweep alone isn't my signal."
- "Asia highs and lows are the edges of the table"
- "No, midnight opening price"
- "I use the 50% -61.8% fib retracement as my golden pocket zone"
- "The key for me is getting a 5 min close below, once I got it I waited a few points and entered short"
- "I wait until after 10AM. The 9 to 10AM range is established."
- "Take partials every 25 points."
- "The bodies tell the story. The wicks do the damage."
- "I only look at VWAP when I'm considering a Continuation trade... Typically my style is to trade reversals at key time based levels"
- "30 point stop, 100 point win"

- "Check out sessions by TFO"
- "I do not have any mentorship or sell any product"
- "overtrading is the worst sin"
- "Cash a is a strong position"
- "I'm not big on that SMT train"
- "Sunday @ 6PM EST the market printed a fresh NWOOG"
- "Sweep → reclaim → opposing liquidity" (2025 wording)

Raw reconstruction from public X search and thread fetch. Not a complete official archive. Pair with greenbirdtrader-trading-framework.md for the distilled rules.
